NB: make sure an X, Y, Z axis is printed on silkscreen

Dots on BHI and BMM should be on same relative corners in layout to orient

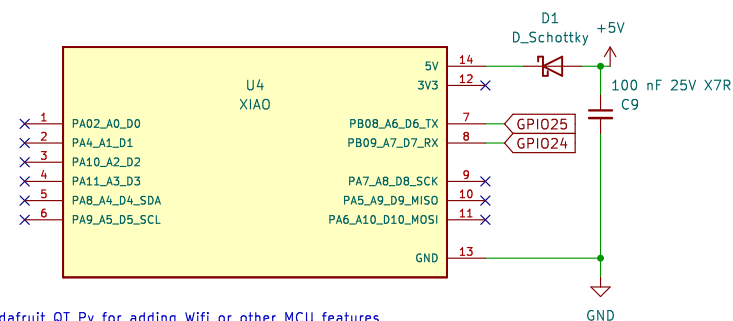

LSM should dot top right and LIS should be dot bottom right

VBAT not used since entire system is connected to battery

BMP390 the 7-bit device address is 111011x. The 6 MSB bits are fixed. The last bit is changeable by SDO value and can be changed during operation. Connecting SDO to GND results in slave address 1110110 (0x76); connection it to V DDIO results in slave address 1110111 (0x77), which is the same as BMP180's I²C address. The SDO pin cannot be left floating; if left floating, the I²C address will be undefined

Xiao or Adafruit QT Py for adding Wifi or other MCU features

The slave address of the IC is 0xD2h/0xD3h
The least significant bit is
the read/write indicator (1 for read, 0 for write)

V_{sys} is guaranteed 4V – 14V
V_{sys} should be between V_{sysmin} (8.4V programmable)
to V_{battreg} (12V, programmable)
Max Current 10A

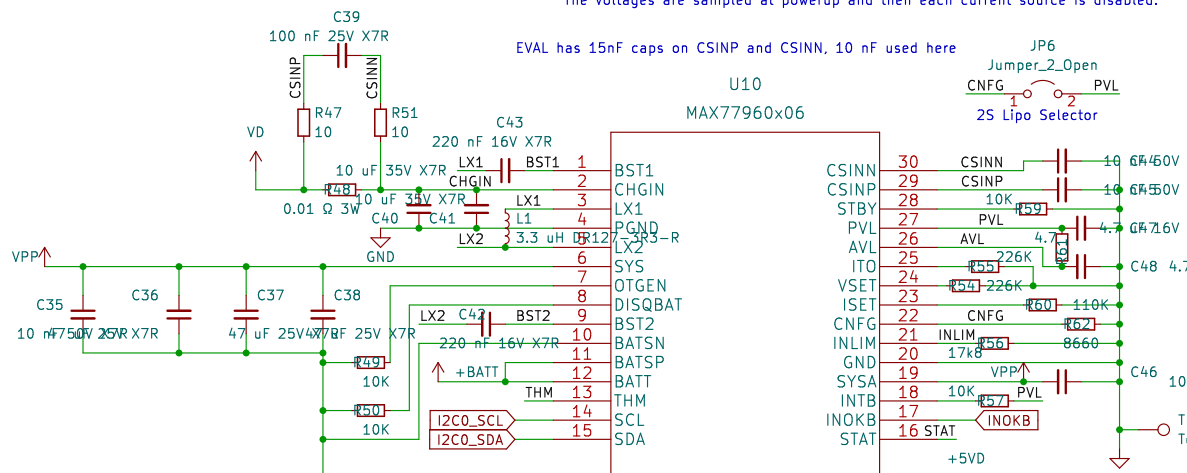

TI has some nice alternatives
but currently impossible to find
bg25792

Extra header
for XT60 connector (7.2 mm pitch)
From other pin of terminal

lower the inductor DCR (DC resistance) is, the higher the buck-boost efficiency is
DR127-3R3-R, SER2915, 7443320330

No voltage is measured across the config resistors after powerup.
The voltages are sampled at powerup and then each current source is disabled.

EVAL has 15nF caps on CSINP and CSINN, 10 nF used here

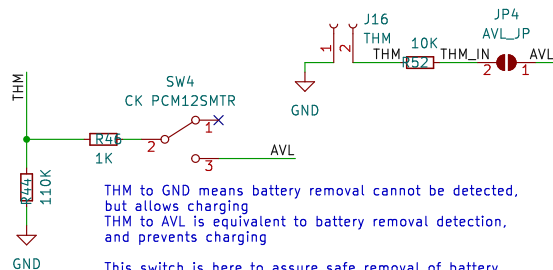

+5V
↑
D_GREEN
D10

Voltage/Power sensing resistor

LIPO Charging LED
STAT goes high when no charge or no power
Cycles low/high when charging and low when charged

STAT tied to PVL with 200K in datasheet. no LED there

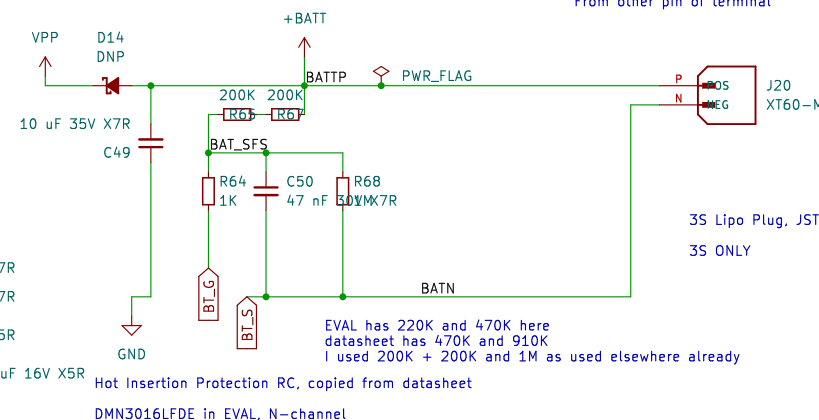

This switch is here to assure safe removal of battery

Optional thermistor, as shown can only detect too hot to charge unless THM to GND pull down is removed

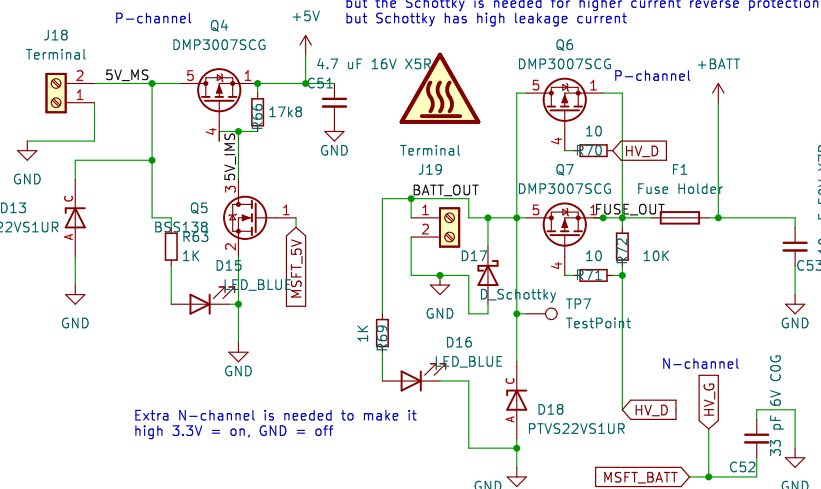

BST1 PWR_FLAG
BST2 PWR_FLAG
AVL PWR_FLAG

FETS are Terminals, controlled by switch from MCU

The primary distinction between an N-Channel and a P-Channel MOSFET is that the N-Channel is usually connected to the Ground (-) side of the load, while the P-Channel is connected to the VCC (+) side

TVS good for surge suppression
these TVS have some inductive load rev protection (500 mah)
but the Schottky is needed for higher current reverse protection
but Schottky has high leakage current

Extra N-channel is needed to make it
high 3.3V = on, GND = off

"For parallel mode, you are welcome to connect the SW1 and SW2 pins together or leave them untied. We suggest floating them in parallel mode to avoid the wrong SMT."

Useful: <https://community.element14.com/products/roadtest/b/blog/posts/mps-mpm54304-evm-roadtest---snippets>

Different Suffix versions of MPM54304 have different default settings for which VOUT can be parallel (diff startup times otherwise). Suffix 0002 is expected, 0004 should also work without modification

R0 between the two separate V5 nets should allow for the not-parallel setup of the 0001 and 0003 suffixes, DNP this part for those

By default, the I2C slave address is 0x68

U12
MPM54304-0002

GPIO default is PG (power good)

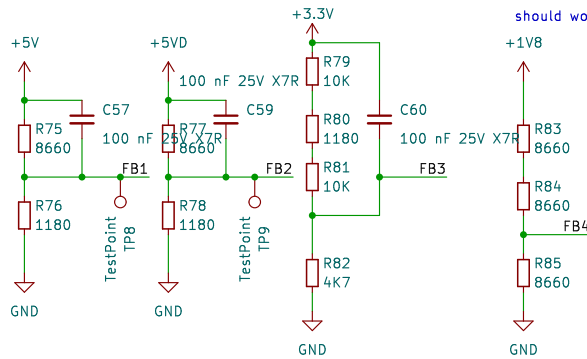

EVAL board shows PG to VCC with 100K I'm using 200K just for simpler BOM

PG
TP10
TestPoint

Space for optional large ripple capacitors

1150 for 5.118V
1170 for 5.041V
1180 for 5.003
against 8660
can do 8660 + 27R for slightly higher

4K7 v 1K for 3.42V
8660 v 1910 for 3.32V
(1180 + 470 + 470) v 470 for 3.306V
8660 + 1k + 1k vs 1180 + 1180 for 3.363
10k vs 1k + 1180 for 3.352
4k7 vs 1k + 27 for 3.346

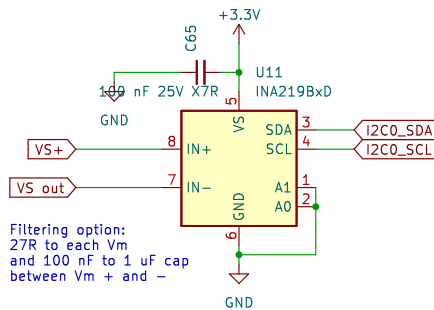

should work with any 3 same R for 1.8V

Voltage Dividers to set Buck V outs

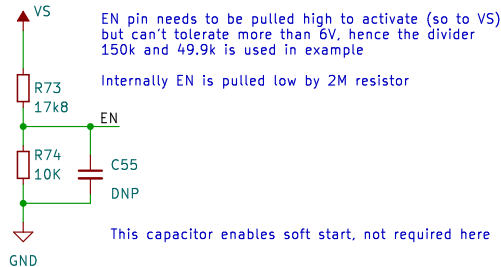

FB Voltage on must suffixes is 0.6 V which I assume is the same as Vref

A feed-forward cap on these Vout to FB can be used Helpful when large current loads are present 33 nF is recommended

Filtering option:
27R to each Vm
and 100 nF to 1 uF cap
between Vm + and -

I2c address: 1000000 with gnd and gnd, 0x40

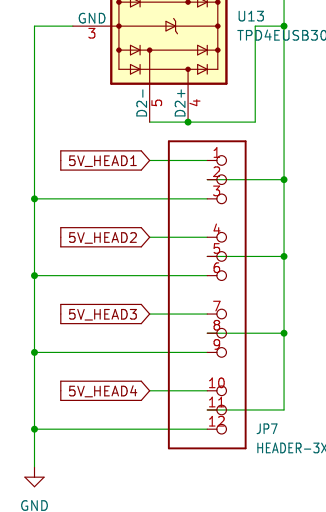

EN pin needs to be pulled high to activate (so to VS) but can't tolerate more than 6V, hence the divider 150k and 49.9k is used in example

Internally EN is pulled low by 2M resistor

This capacitor enables soft start, not required here

Using same USB TVS to minimize unique parts
